Koda AI

Find the right AI tool. Compare options. Rewrite your prompts.

A bilingual progressive web app whose language model runs inside your device's browser.

LIVE ON GOOGLE PLAY · BUILT BY RICCARDO PONTE

THE PROBLEM

Choosing an AI tool is now a job of its own

"Which tool can actually edit my Excel file, not just read it?" is a hard question to answer quickly.

01

Too many options

Text, image, video, audio, code and data tools all overlap, and their marketing pages all sound alike.

02

Vague capabilities

Creating, reading and editing a format are different operations. Listings rarely separate them, so you find out after signing up.

03

Assistants with a catch

Asking a cloud assistant usually means an API key or an account, and your prompt leaves the device. It may also invent an answer.

THE SOLUTION

One app from "what should I use?" to a better prompt

TODAY

- Comparing tools across a dozen open tabs
- Guessing whether a tool supports the operation you need
- Rewriting the same weak prompt until something works
- Learning AI concepts from scattered, jargon-heavy sources

WHAT KODA AI BRINGS

Catalog with verified operations

Browse by specialization (Excel, Word, PowerPoint, PDF, images, video, audio, code, data, automation) and by create, read or edit.

A private assistant and clear comparisons

Ask in plain language with no API key. Comparisons state their criteria, and conversations stay on the device.

Prompt optimizer and Learn

Prompts rebuilt around role, context, constraints and output format, plus 22 concept cards with animated diagrams.

If no tool covers the operation you asked for, Koda says so instead of claiming an unverified capability.

WHY IT IS DIFFERENT

A small model, made reliable by the engineering around it

ON-DEVICE LLM

SmolLM2 in the browser

SmolLM2-135M-Instruct runs through Transformers.js on WebGPU or WASM, in a dedicated Web Worker. Prompts never reach an inference server.

DETERMINISTIC RAG

Facts come from the catalog

Results are retrieved from Firestore and ranked locally by name, category, alias, price, specialization and capability, with typo tolerance.

GUARDRAILS

Every output is validated

Language, topic, repetition, prompt leaks, invented URLs, numbers and names are checked. A failed reply falls back to a verified draft.

No server inference cost. No API key. Prompts stay private.

Started as: a chatbot on the Google Gemini API. **Now:** re-architected to run entirely on the device.

TRUST BY DESIGN

It says what it knows, and admits what it does not

Explicit consent

The model is downloaded only after the user agrees, then cached in OPFS so it is not fetched again.

Explicit conversation flows

State machines drive find, compare and explore, so the model never decides on its own what the app does next.

Privacy on the record

The Play Store data safety section declares no data shared with third parties and no data collected.

~118 MB
one-time model download

0
API keys needed for the assistant

22
concept cards in English and Italian

2
inference backends: WebGPU and WASM

Known limit: the local model is small, so its output should be checked. Koda tells users that directly.

UNDER THE HOOD

From question to validated answer, on the device

User question, in English or Italian

STEP 1 · ROUTE

State machine

Identifies the flow (find, compare or explore) and handles disambiguation.

STEP 2 · RETRIEVE

Firestore catalog

Deterministic local ranking builds a verified draft before the model runs.

STEP 3 · GENERATE

SmolLM2-135M in a dedicated Web Worker

WebGPU
q4f16, 120 s timeout

WASM
q4, 240 s timeout

OPFS
local model cache

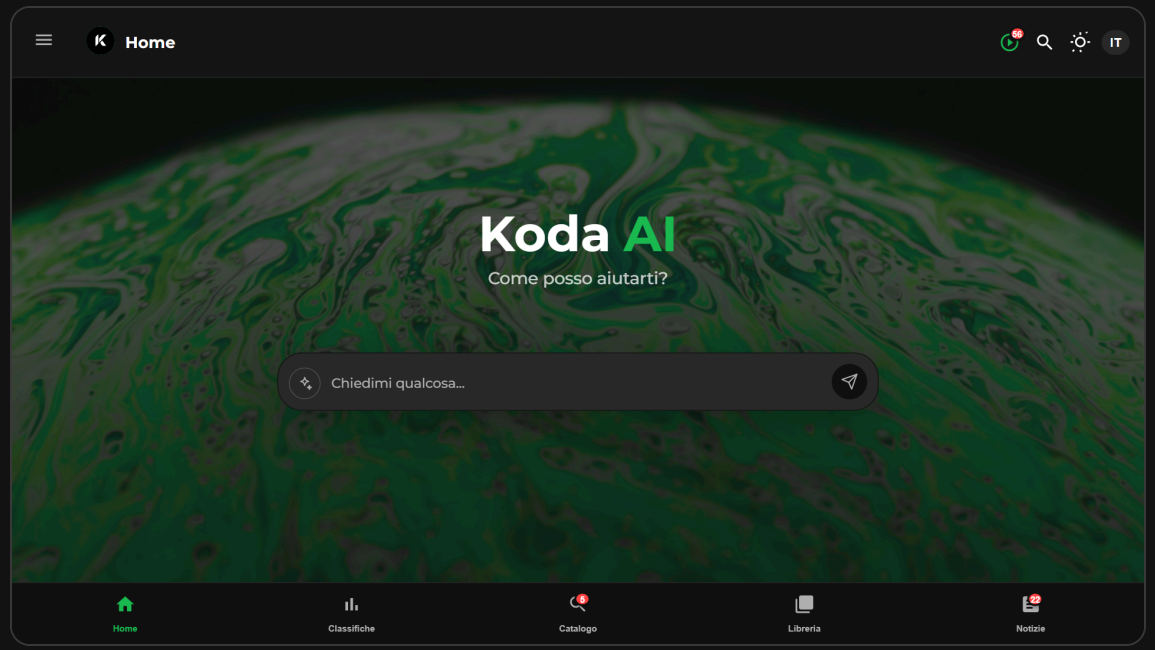

STEP 4 · VALIDATE EVERY OUTPUT

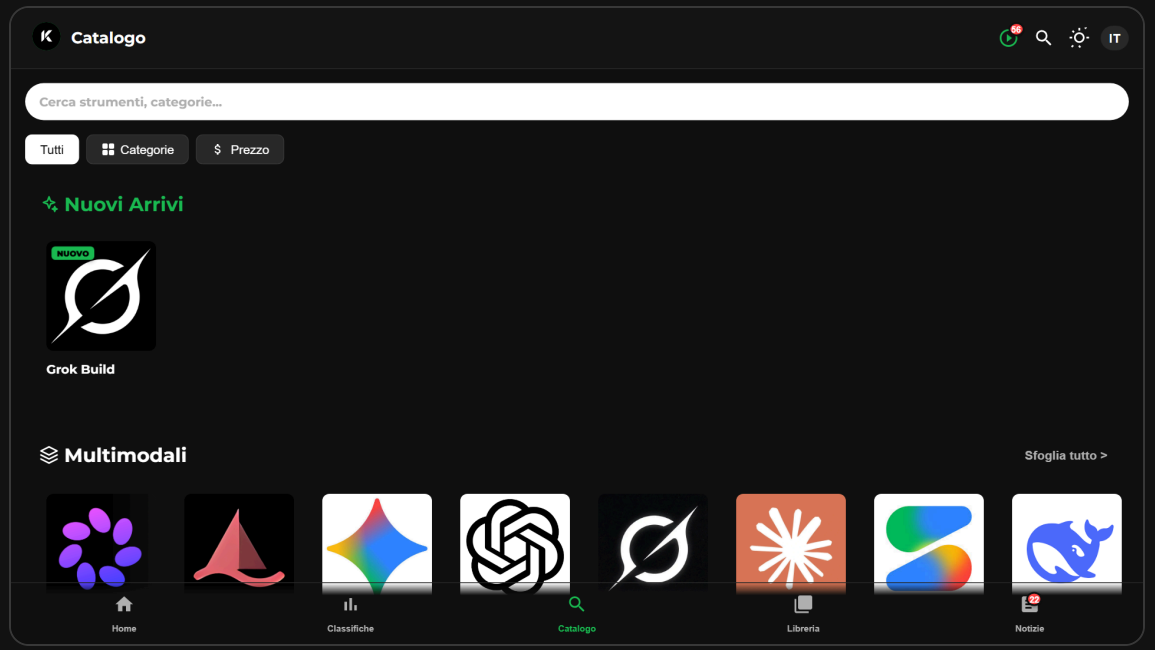

Language · Topic · Repetition · Prompt leak · Invented URLs · Numbers and names

On failure: the user receives the verified deterministic draft, not an unchecked reply.

SEE IT RUN

Ask a question, or browse the catalog

Home

A single input opens the on-device assistant.

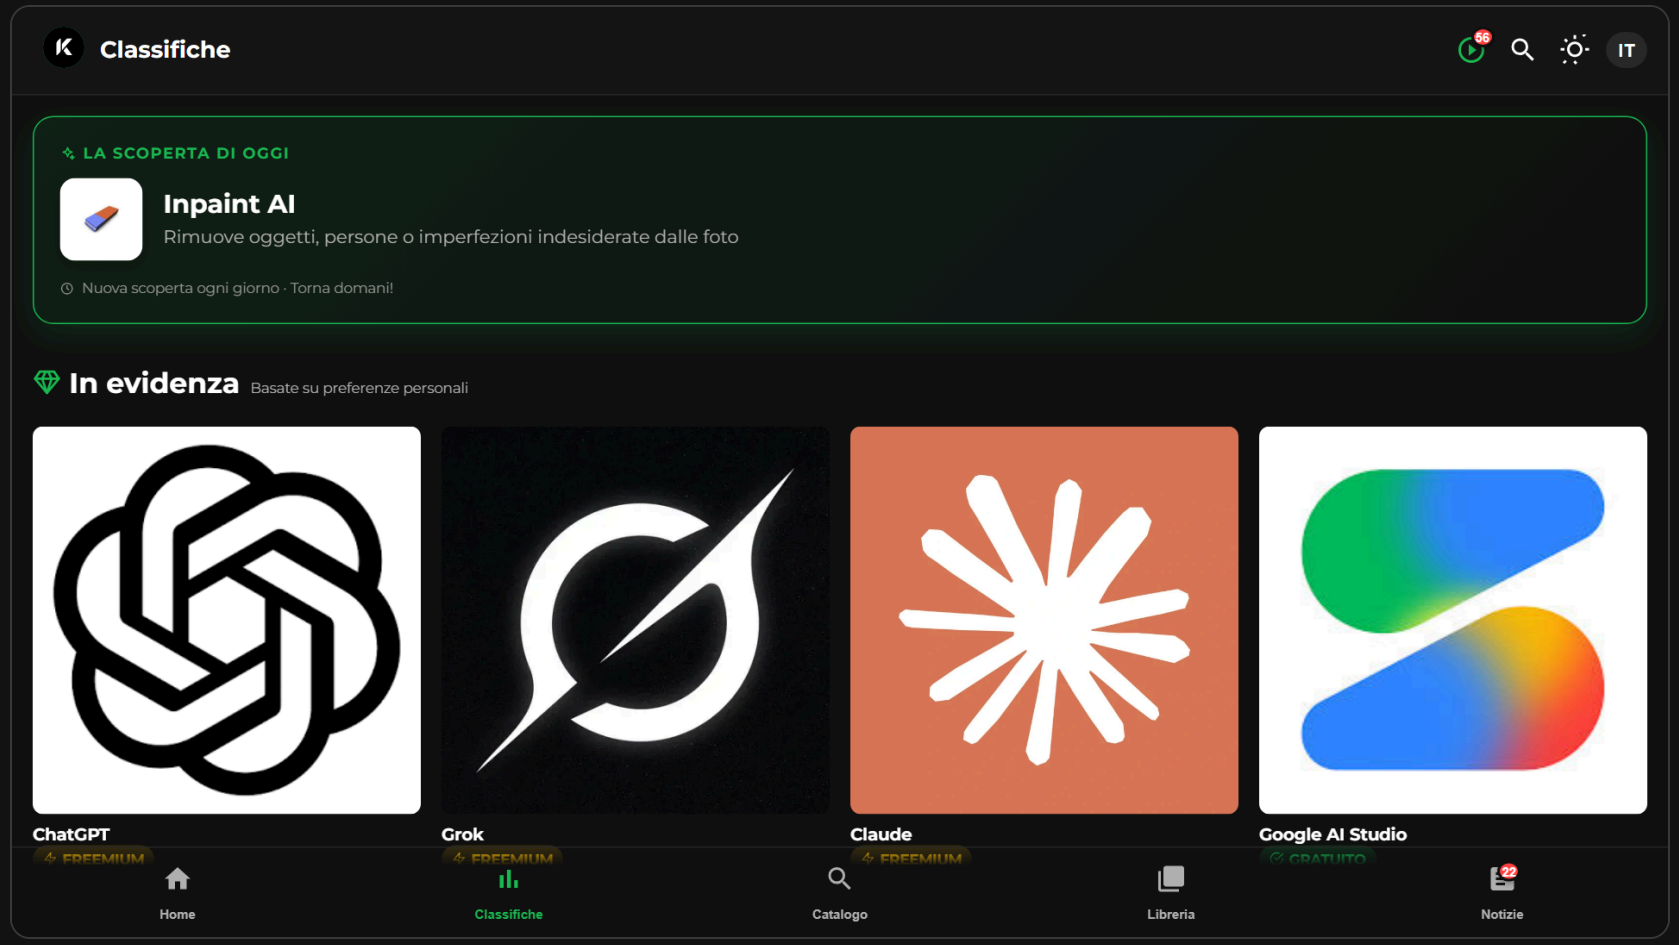

Catalog

Search, then filter by category and price.

Real screens from the Google Play listing, shown in the Italian UI. English is available from the language switch.

LIVE PRODUCT

Shipped and available on Google Play

5

sections: Home, Rankings, Catalog, Library and News

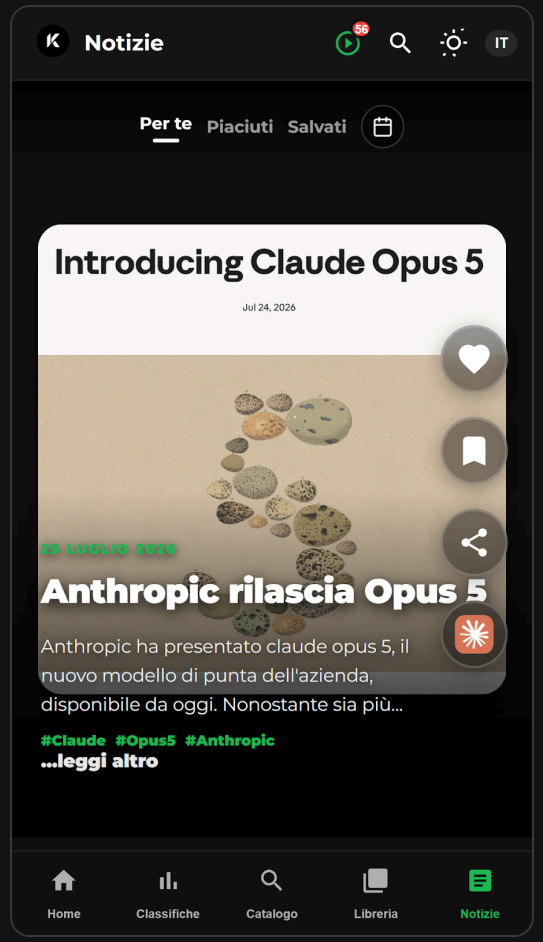

A reason to come back

Rankings opens with a daily tool discovery and highlights based on personal preferences.

Customizable navigation, theme and language are part of the same experience.

ENGINEERED TO SHIP

Web and Android from one codebase, with no build step

One person owned product, UX and engineering, from the first commit to the store listing. News and video link straight back to catalog entries, so the app stays one connected product.

OFFLINE

PWA first

Service Worker, Web App Manifest, and localStorage plus OPFS for local state.

DEPLOY

Automated

GitHub Actions publishes to GitHub Pages. Android is packaged for Google Play.

TESTS

Regression safety

Node test runner with a simulated Worker covers the local AI layer.

Inside: HTML5, ES Modules, React 18 via esm.sh, Firebase and Firestore, Transformers.js 4, jsPDF, pdf-lib, pdf.js and QRCode.js.

THE PAYOFF

Less searching, and answers you can check

WITHOUT KODA AI

- ✖ Searching tool by tool across marketing pages
- ✖ Unclear whether a tool can create, read or edit a format
- ✖ Prompts sent to a remote server, often with an API key
- ✖ Confident answers that may be invented
- ✖ Weak prompts, rewritten by trial and error

WITH KODA AI

- ✓ One catalog, organized by specialization
- ✓ Create, read and edit stated for each tool
- ✓ Conversations stay on the device, with no API key
- ✓ Replies validated, and "no tool covers this" when that is the truth
- ✓ Prompts structured by role, context, constraints and format, saved to a gallery

Koda AI

The right AI tool, found on your own device.

Available now on Google Play.
